

User Manual — Noxa

Ad & Tracker Blocker for Android

1. What is Noxa

Noxa protects your phone by blocking ads, trackers, and tracking attempts, entirely on-device, without sending your data to external servers. It works in the background through a local VPN service.

2. Enabling protection

1. Open the **Noxa** app
2. Tap the main switch to turn it on
3. On first launch, Android will ask for permission to set up a VPN connection — tap **OK / Allow**
4. When the switch turns blue and you see **"Protected — trackers and ads are being blocked"**, protection is active

3. Important: turn off battery restrictions

For Noxa to keep working correctly **at all times** (including with the screen off or when you're not actively using the phone), the battery management system must not be allowed to kill the app in the background. Without this step, protection can silently stop after a while.

The steps differ by phone manufacturer. Find your device below.

Stock Android / Pixel / Nokia / Motorola

1. **Settings** → **Apps**
2. Select **Noxa**
3. Tap **Battery usage details** (or **Battery**)
4. Select **Unrestricted**

If the option is greyed out, leave Noxa running for a few hours — Android only unlocks this menu once it has recorded some battery usage for the app.

Samsung

1. **Settings** → **Apps** → **Noxa**

2. Battery

3. Select **Unrestricted** (not "Optimized" or "Sleeping")
4. Recommended: **Settings** → **Device care** → **Battery** → **Background usage limits** → add Noxa to the "**Never sleeping apps**" list

Xiaomi / Redmi / POCO (MIUI / HyperOS)

1. **Settings** → **Apps** → **Manage apps** → **Noxa**
2. **Battery saver** → select **No restrictions**
3. **Autostart** → enable the toggle for Noxa

⚠ On MIUI/HyperOS, VPN-based apps (like Noxa) are sometimes blocked from being added to Autostart by the system itself, even when you try to enable it — this is a known platform limitation, not a bug in Noxa. If Autostart won't stay on, also try disabling **MIUI Optimization** in **Settings** → **Additional settings** → **Developer options**, and lock the app in Recents (see below) as a workaround. All three settings matter — doing only one is usually not enough on this brand.

Oppo / Realme / OnePlus (ColorOS)

1. **Settings** → **Battery** → **App battery usage** → Noxa → **Don't optimize**
2. **Settings** → **App management** → **Auto-launch** → enable Noxa
3. From the Recents screen, long-press the Noxa card → tap the **lock** icon so the system won't clear it when recent apps are wiped

Huawei / Honor (EMUI / MagicOS)

1. **Settings** → **Battery** → **App launch**
2. Find **Noxa** and turn off automatic management
3. Manually enable all three options:
 - **Auto-launch**
 - **Secondary launch**
 - **Run in background**

Vivo (Funtouch OS / OriginOS)

1. **Settings** → **Battery** → **High background power consumption** → Noxa → enable
2. **Settings** → **Apps & permissions** → **Autostart** → enable Noxa

4. How to check protection is working

- The VPN icon (a key or shield) should stay visible in the notification bar the whole time Noxa is active
- Open Noxa and check the "**tracking attempts blocked**" counter — if it keeps increasing as you browse, protection is working
- If the VPN icon disappears without you turning the app off, revisit the section 3 steps for your phone model

5. FAQ

Why does Noxa need a VPN connection?

This is the standard way an Android app can filter other apps' traffic without root access. Noxa doesn't send your traffic to an external server — filtering happens locally, on the phone.

Does Noxa slow down my internet?

It shouldn't — local filtering adds a negligible delay.

Can I turn off protection temporarily?

Yes, from the app's main screen, using the same

switch used to enable it.

Does the app use a lot of battery?

A local VPN service runs constantly, but usage is low, comparable to a messaging app active in the background.

Manual version: 1.0 – for Noxa v1.1.1

Battery/autostart steps checked against current (2026) MIUI/HyperOS, ColorOS, EMUI and OneUI documentation.
